

CTF Walkthrough

WEB Challenge

Cure Me

75 Points

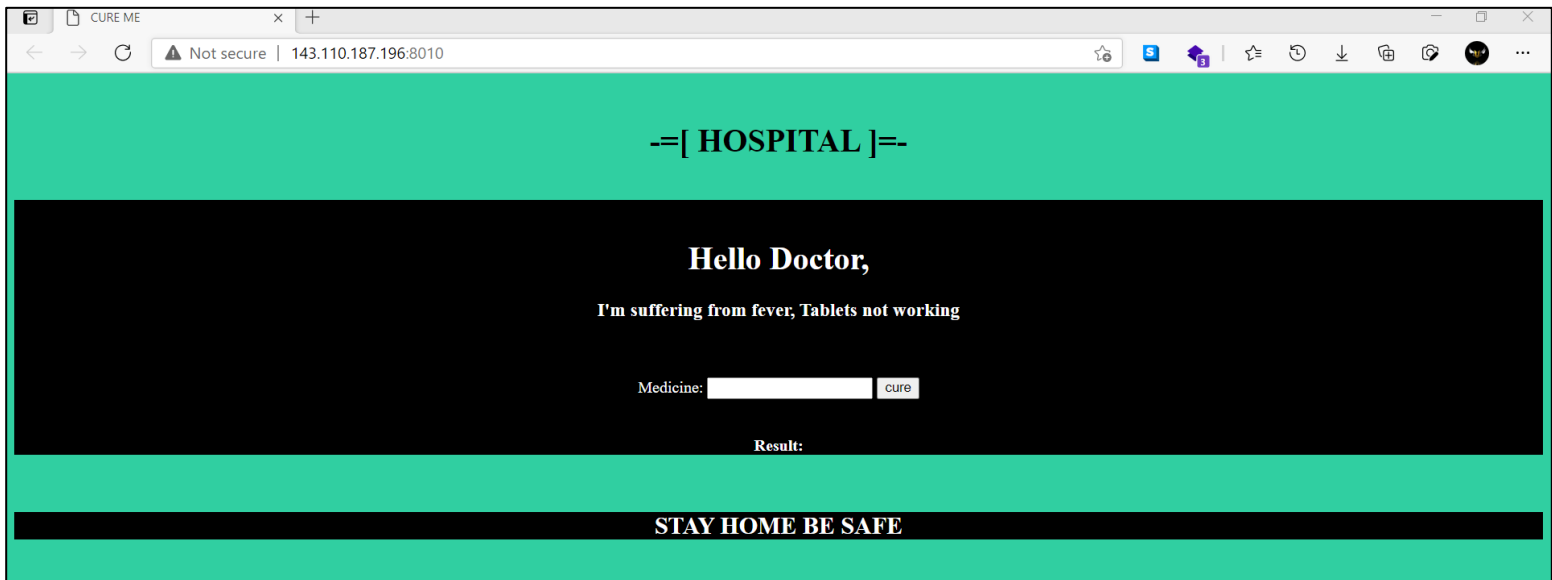

Cure Me

(75 Points)

A person is suffering
from fever,give him
medicine and try to cure
him

>>Click Me

First open up the challenge. A web page will be opened.

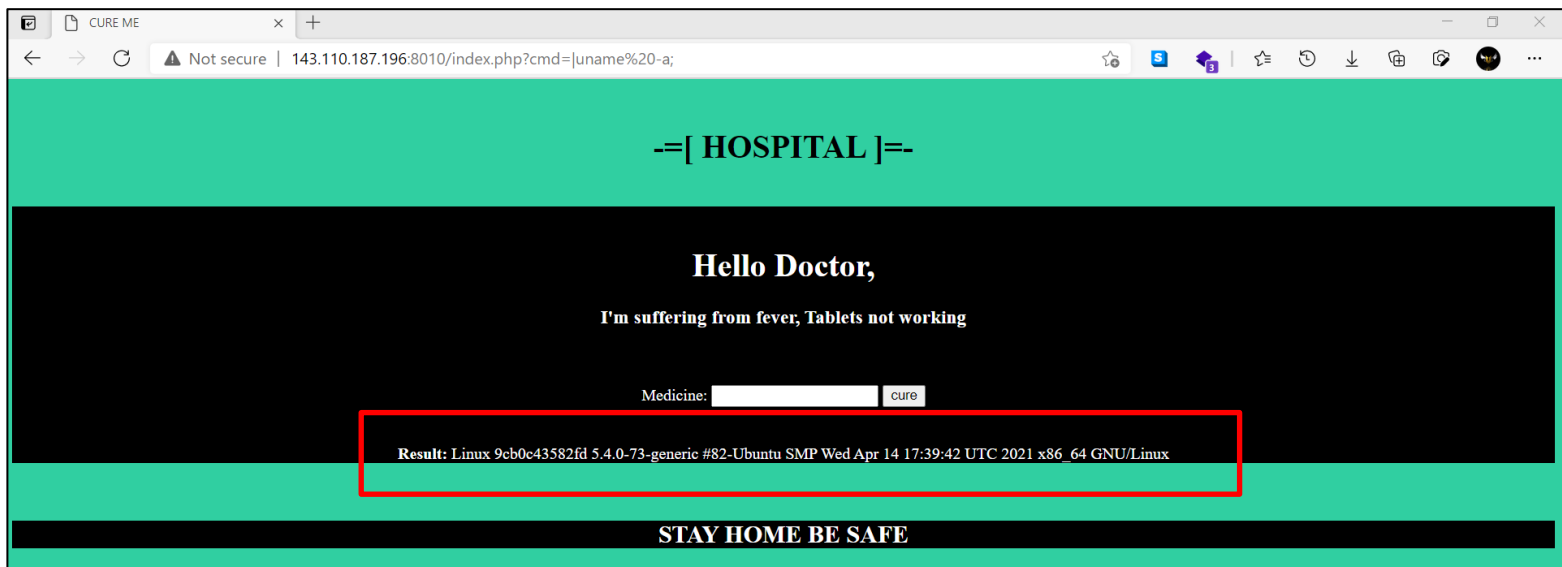

It shows “Tablets not working” so I assumed it has a injection type of vulnerability to solve this challenge.

It has a single input parameter. I just tried inserting a random string “flag” and I noticed the change in URL.

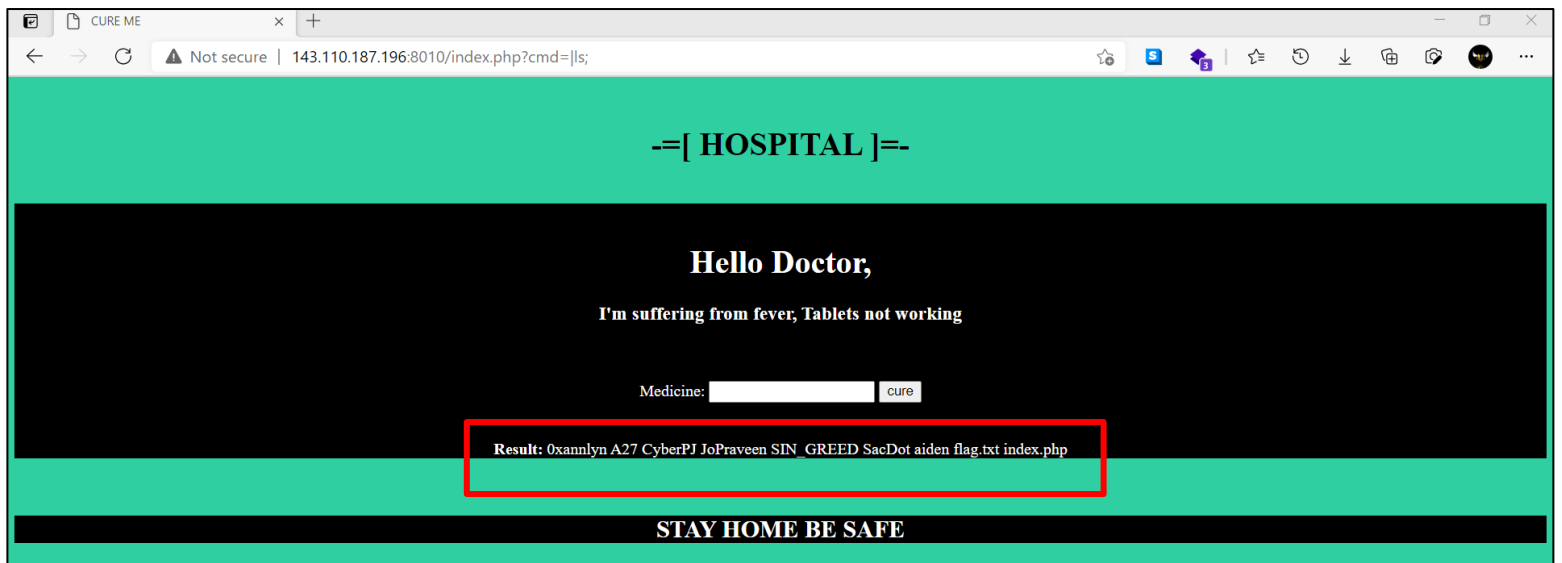

<http://143.110.187.196:8010/index.php?cmd=flag>

At first, I tried for Command Injection Vulnerability. I tried inserting `|uname -a;` and it successfully worked!!! It displays OS name , version.....

So, the command injection vulnerability exists!!!! Let's try to list out the available directories using `|ls;` command.

There is a flag.txt file but it's a fake flag!! So, I started checking the directories and found a valid flag under `/aiden`.

Command used: `| cat aiden/flag.txt`

THE END
